

## YARN RECYCLING?

*“We must work together to protect our planet and people and ensure a greener, more resilient future for us all.”* UN Climate Change Conference COP26

Recycled and regenerated yarns are becoming more and more important for the textile industry and for consumers.

Winder model SED besides its main applications (knitting and hosiery) allows you to recycle yarns from “used” clothes, socks and panels.

SED, in fact, can recover yarns from any fabrics that can be de-knitted by hands. The yarn recovered by the machine is fully “regenerated”, waxed and ready to be re-used for new textile products.

Each spindle is fully independent and can either recover or wind and power consumption is lower than 100W per spindle.

*Make you apparel greener!*
